

The refreshing taste of *liquid* DeFi

Swap, lend, and mint across
12+ chains in one clean interface

Built on  SONIC

Cross-chain DeFi is still broken. SODAX makes it simple

With SODAX, Sonic is not just a fast L1 — it's a liquidity hub.

We're building a unified liquidity layer that **powers swaps, lending, and stablecoin flows** across 12+ EVM and non-EVM chains.

DeFi's Problems Today

- **Liquidity is fragmented** across chains, apps, and wrapped assets.
- **Users bounce** between wallets, RPCs, bridges, and aggregators.
- **Builders are stuck** maintaining gas logic, bridge SDKs, or LP fragmentation.
- **Lending protocols are gated** by emissions or high collateralization.

How SODAX Solves This

- 📁 **Unified UX** — Any bridging, wrapping or chain switching is abstracted away.
- 🔗 **Native asset routing** via Solver SDK — no gas logic, no custom bridge handling.
- 🐷 **Protocol-owned liquidity** enables ~2% APR borrowing with real, sustained depth.
- 🌀 **Makes Sonic composable** by powering swaps, CDPs, and unified user flows.

Supported chains

A faster way to go cross-chain — without rebuilding everything

What SODAX Provides

- **Solver SDK** → Lightweight routing layer with automatic pathfinding and native token handling
- **Protocol-Owned Liquidity** → No need to bootstrap or rent pools. Tap into capital that moves with the user
- **Multi-chain Support** → Built-in access to 12+ EVM + non-EVM chains, including Solana, Stellar, Sui, Injective
- **Stablecoin Flows (bnUSD)** → Mint, borrow, and route stable liquidity natively across networks
- **Sonic Finality** → Instant confirmation and low-latency execution with Sonic's fast infra

What You Can Build

- 📁 **Wallets** → Enable cross-chain swaps or lending natively in-app
- ⚡ **DEXs / Aggregators** → Route through SODAX liquidity as a fallback or primary
- 💵 **Stablecoin Apps** → Mint bnUSD or integrate CDP mechanics into your UX
- 🔗 **Infra Protocols** → Leverage routing as a service, no need to manage bridges
- ⚡ **High-throughput apps** → Take full advantage of Sonic's 10k+ TPS and ~1s finality
- ⇒ **Sonic Gateway & CCIP Integration** → Go composable from day one

All powered by \$SODA — burned with every use, not printed for yield.

A unified liquidity layer, built on Sonic

Intent-based routing, protocol-owned liquidity, and Sonic execution — abstracted into one SDK.

SODAX complements Sonic infra with DeFi-native intent routing, solver orchestration, and unified liquidity execution.

What powers SODAX

App Layer | Abstracted Execution

Apps like SWAP, LEND, bnUSD, and DCA are **modular front ends** that route all actions through Sonic, with no per-chain logic or RPC switching required.

Designed to expose cross-chain functions via a single intent structure.

Execution | Sonic Finality & Fee Compression

All transactions **settle on Sonic** for fast, deterministic finality, removing latency spikes from bridge hops or external L1 congestion.

Execution gas is minimized via intent batching and context-aware routing.

Liquidity & Incentives | Sustainable by Design

SODAX uses protocol-owned liquidity for deep, reliable execution—offering efficiency with no emissions or LP rewards.

Apps earn via Sonic's FeeM, which returns up to 90% of gas fees, while Points tools drive growth without new tokens or VC dependence.

Token Mechanics | Ecosystem Incentives

Validator rewards on Sonic are capped, with most emissions redirected to programs like **Sonic Points (users)** and **Gems (devs)**.

SODAX supports this by ensuring **user activity on apps drives \$SODA burns and onchain volume**, boosting long-term sustainability.

Let's build together

Early-stage builders can apply for the Innovator Fund or co-launch with Sonic Labs support.

Route cross-chain swaps and loans: via SDK — no bridge code, no chain switching

Launch with access to capital: protocol-owned liquidity, already routing across 12+ chains

Borrow at ~2%: native stablecoin borrowing (bnUSD) — no wrapped assets, no emissions

Settle fast: executed on Sonic with ~1 second finality

Fast facts

12+ chains supported including Arbitrum, Sui, Stellar, ICON, Cosmos

Integrated with Uniswap, Cetus (Sui), Stellar DEX

Up to 90% of gas fees returned to apps via **Sonic's FeeM system**

Protocol-owned liquidity → no LP incentives, no emissions

Seamless cross-chain DeFi. All native assets.
