SODAX Descriptions

1. One-liner (tagline): SODAX: Infrastructure for modern money.

2. Short description (~50 words): SODAX is infrastructure for modern money. A cross-network execution and liquidity system spanning 18+ networks. Wallets, DEXs, lending protocols, and networks integrate the SODAX SDK to ship cross-network swaps, lending, borrowing, staking, and settlement without building execution infrastructure.

3. Medium description (~100 words): SODAX is infrastructure for modern money. It is a cross-network execution and liquidity system that coordinates financial actions across 18+ networks, including Ethereum, Solana, Arbitrum, Base, Avalanche, Sui, and more. Through a solver-based execution model and multi-bridge architecture, including proprietary bridging relays and compatibility with LayerZero and CCTP, SODAX powers swaps, lending, borrowing, staking, and settlement across networks.

SDK Partners, including wallets, DEXs, lending protocols, and yield platforms, integrate SODAX to ship cross-network features without building execution infrastructure. Networks connect as spokes to gain cross-network liquidity and user flow.

4. Long description (~200 words): SODAX is infrastructure for modern money. A cross-network execution and liquidity system designed for a financial world that operates across many networks simultaneously.

Today, moving assets between networks is increasingly possible, but reliably executing meaningful financial actions across them is not. Builders face compounding execution complexity. Networks struggle to attract cross-network liquidity. SODAX exists in this gap.

It coordinates execution and liquidity across all major networks, including Ethereum, Solana, Arbitrum, Base, Avalanche, Sui, and Stellar. Its solver-based execution model routes actions across liquidity domains, manages multi-bridge infrastructure through proprietary bridging relays and compatibility with LayerZero and CCTP, handles asynchronous execution, and recovers from failure modes automatically.

SODAX serves two primary B2B audiences. SDK Partners, including wallets, DEXs, lending protocols, and yield platforms, integrate the SODAX SDK to ship cross-network features in days instead of months. Networks connect as spokes to gain cross-network liquidity and execution flow without building bilateral bridges. Houdini Swap, Amped Finance, Hana Wallet, and LightLink are among the partners already building on SODAX infrastructure.
