SODAX Descriptions

1. One-liner (tagline): SODAX - Infrastructure for modern money.

2. Short description (~50 words): SODAX is infrastructure for modern money. A cross-network execution and liquidity system spanning 17+ networks. Transact directly on sodax.com, or build with the SODAX SDK to bring cross-network capabilities into your own application. One system for swaps, lending, borrowing, and settlement.

3. Medium description (~100 words): SODAX is infrastructure for modern money. It is a cross-network execution and liquidity system that coordinates financial actions across 17+ networks, including Ethereum, Solana, Arbitrum, Base, Avalanche, Sui, and more. Through a solver-based execution model and multi-bridge architecture, including proprietary bridging relays and compatibility with LayerZero and CCTP, SODAX powers swaps, lending, borrowing, staking, and settlement across networks.

Users access these capabilities directly through the SODAX DeFi app at sodax.com. Builders integrate SODAX through a modular SDK to bring cross-network features into their own wallets, DEXs, lending protocols, and applications.

4. Long description (~200 words): SODAX is infrastructure for modern money: a cross-network execution and liquidity system designed for a financial world that operates across many networks simultaneously.

Today, moving assets between networks is increasingly possible, but reliably executing meaningful financial actions across them is not. Users face fragmented liquidity and disjointed tools. Builders face compounding execution complexity. SODAX exists in this gap.

It coordinates execution and liquidity across all major networks, including Ethereum, Solana, Arbitrum, Base, Avalanche, Sui, and Stellar. Its solver-based execution model routes actions across liquidity domains, manages multi-bridge infrastructure through proprietary bridging relays and compatibility with LayerZero and CCTP, handles asynchronous execution, and recovers from failure modes automatically.

For users, SODAX is a DeFi application at sodax.com where you can swap, lend, borrow, stake, migrate, and bridge across networks in one place. For builders, SODAX is an SDK and set of infrastructure tools that absorb cross-network complexity so teams can ship cross-network features in days instead of months. Houdini Swap, Amped Finance, Hana Wallet, and LightLink are among the partners already building on SODAX infrastructure.

Wallets, DEXs, lending protocols, and new networks run on SODAX infrastructure today, with a growing cross-network money market supporting lending and borrowing across networks.
